SHARING SESSION

AI in Digital Product Design

How AI is leveraging the way we design, and the products we design for.

by Soma Wiraga

AGENDA

What We'll Cover

01

Framing & Reframing Design Problems

Why the brief you are handed is rarely the problem worth solving.

02

Design Process Using AI

How our team is folding AI tools into everyday design work, with four examples.

03

Design for AI-Powered Products

What changes for design when the product itself is powered by AI.

PART 01

Framing & Reframing Design Problems

FRAMING · 01

How Requests Usually Arrive

A problem and a solution, already welded together

PROBLEM

“Website has low conversion”

SOLUTION

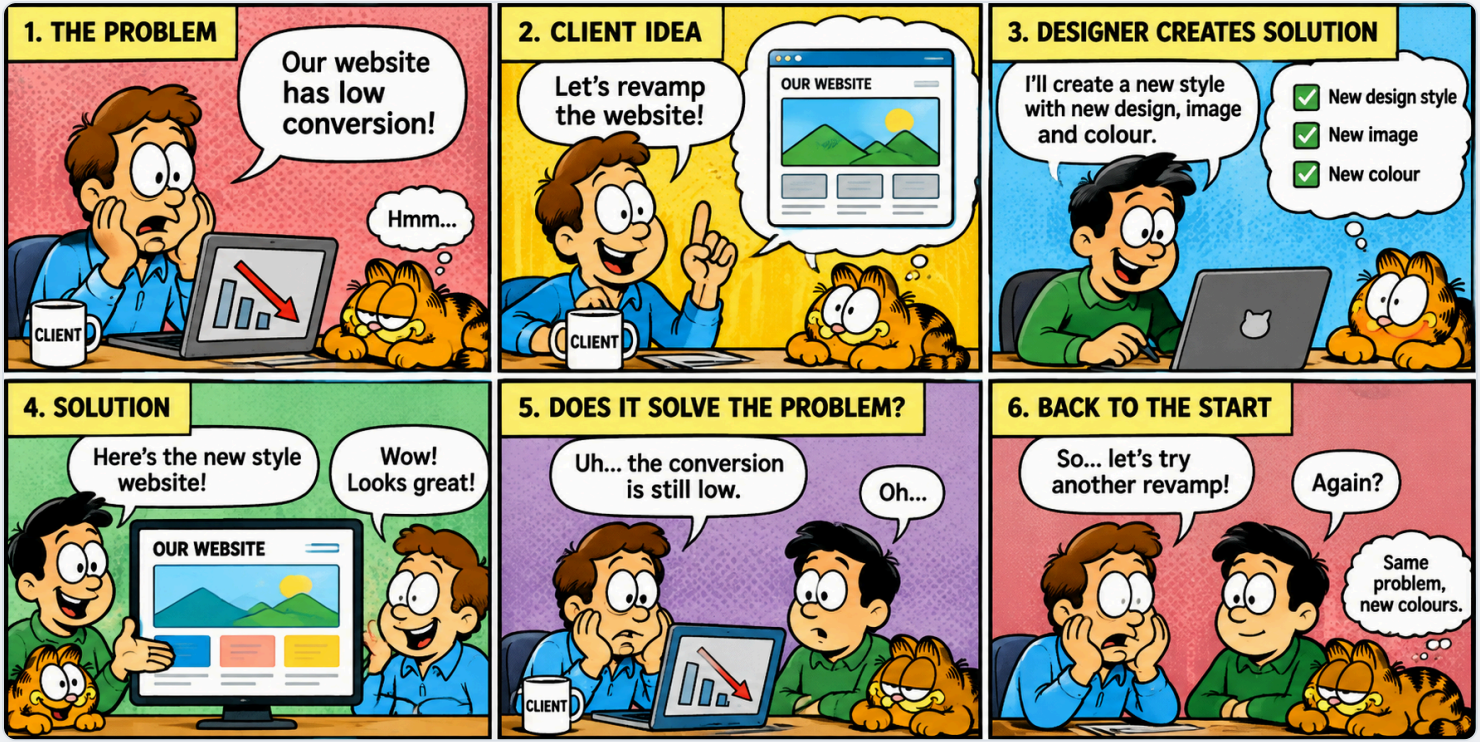
“Revamp the website”

FRAMING · 02

Working From a Predefined Solution

‹ Comic Strip Diagram ›

The client brings the answer; the designer follows exactly

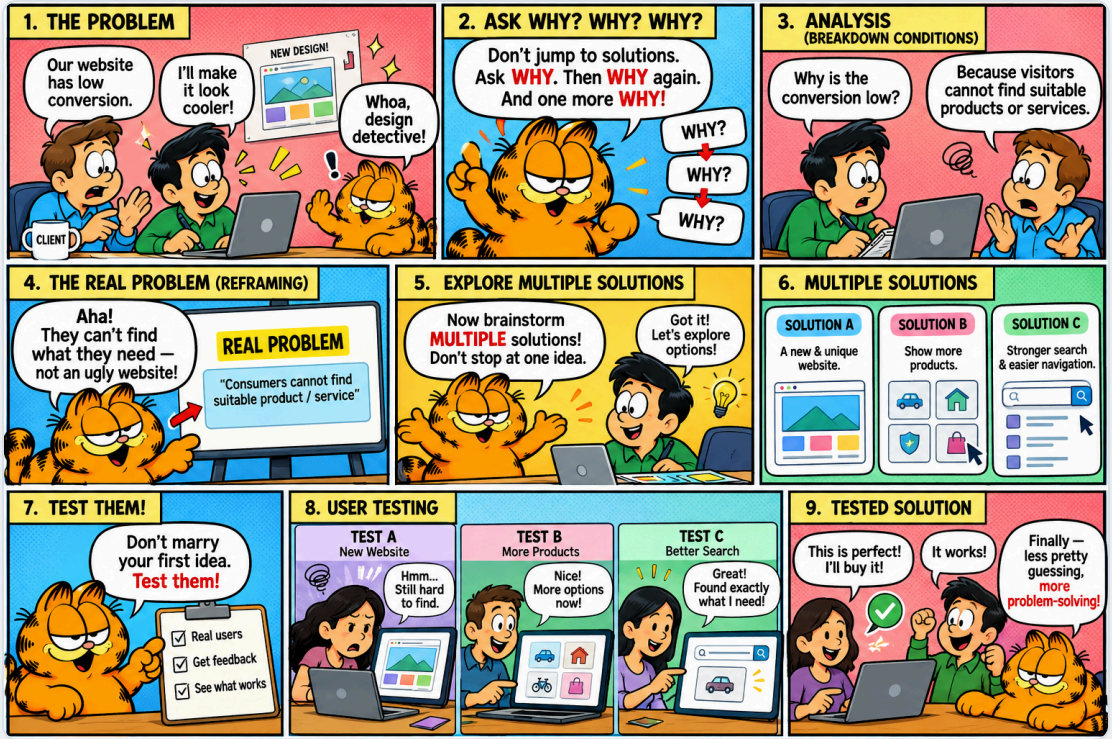


FRAMING · 03

Framing or Reframing the Problem

‹ Comic Strip Diagram ›

Ask why until the real problem surfaces, then explore more than one answer



FRAMING · 04

Framing in Design

Vermaas, Dorst & Thurgood, 2015

Transportation

In a music festival, people would be able to get there but also leave when they want. In the entertainment district, train services ended around the same time that peak influx of patronage begins. Apart from the obvious improvement of providing more trains at the nearest station, the designers also implemented a back-up system of temporary signage to lead towards a different nearby station that has trains running all night

Three framing steps

S = original situation · G = goal · Ğ = reformulated goal · F[T] = frame · F[Ť] = new frame

Goal reformulation in a design task

$(S,G) \rightarrow (S,\check{G})$ or $(S,G,F[T]) \rightarrow (S,\check{G},F[T])$

Framing the situation in a design task

$(S,G) \rightarrow (S,G,F[T])$

Reframing the situation in a design task

$(S,G,F[T]) \rightarrow (S,G,F[\check{T}])$

FRAMING · 05

Case: “Customers Are Cancelling”

Homesite Insurance servicing platform · mcv.design/reducing-policy-cancellations

STATED PROBLEM

“Cancellations are spiking — we have a retention problem.”

Proposed answer: discounts, outreach, save offers at the point of exit. Thousands of calls a day at $18 a call.

THE REAL PROBLEM

Customers weren't leaving — they were lost.

Most were moving, buying a first home, or needed temporary cover. With no transfer or re-quote path in the UI, cancellation was the only door — and no intent data was captured.

THE REFRAME

From cancellation handling → intent routing

Surface intent early

A moving path in servicing nav, before the cancel flow

Support intent late

Reason-based branching with relevant alternatives

Capture structured data

A reason code on every exit, so the system can learn

$4.3M
premium retained

7,560
customers kept

360K+
calls redirected

FRAMING · 06

Case: “Nobody Covers Us”

Veracity Insurance Solutions · virgo-pr.com/veracity-insurance-pr-case-study

STATED PROBLEM

“How do we get journalists to write about our insurance?”

FLIP, Veracity's food-business insurance brand, had almost no earned media despite a large market.

THE REAL PROBLEM

The product was never the story.

Reporters won't keep covering policies and coverage limits — but they will cover the small businesses behind them, which is exactly the data Veracity already held.

THE REFRAME

“What does Veracity know that journalists want to know?”

Publish original research

A ~50-page State of the Food Industry report, not a press release

Split it into many stories

One finding per beat: restaurants, small business, finance, local

Make it repeatable

The same engine rerun for each brand's community

30+
first placements

15+
research reports

25+
exec bylines

ACTIVITY

Reframe It

Clear notes

Write a stated problem, ask why three times, then write the real one

PART 02

Design Process Using AI

DESIGN PROCESS

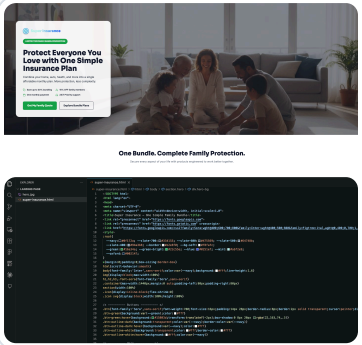
Ways to Use AI

Four tools, four different kinds of output

CHATGPT

AI-Generated Character Images

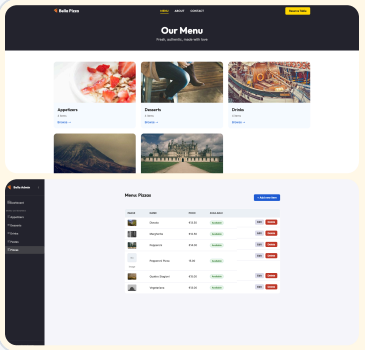
Concept art for product characters, generated directly from prompts.



FIGMA + CLAUDE

AI-Generated Static Website

A design-to-code static site, built from a Figma file with an AI coding agent.



PAPERCLIP

AI-Generated Dynamic Website with CMS

A full dynamic site with a working CMS, generated end to end.

CLAUDE CODE + RIVE

AI-Assisted Agent Interaction

An animated AI avatar whose expressions are built in Rive by prompting a coding agent.

DESIGN PROCESS

AI-Generated Character Images

Using structured prompt to create a consistent image generation

Character Name: Insurance Mascot v02

A professional automotive technician mascot representing an automotive insurance company. A friendly young adult male with a clean illustration style, designed for satisfying customer service and punctual service.

Identity

Male, ~28–30 years old · Slim medium-height build · Friendly, polite appearance · Consistent facial structure · Neat short black side-part hairstyle (70/30 split) · White cap · Medium expressive eyes · Warm smile · Light-medium brown skin tone · No facial hair

Outfit

White slim jacket with white cap, long sleeves · Dark teal slim-fit jeans, casual modern fit · White sneakers, clean minimalist style

Personality

Friendly · Approachable · Helpful mentor · Creative · Intelligent · Curious learner · Positive and confident · Collaborative team player

Art Style

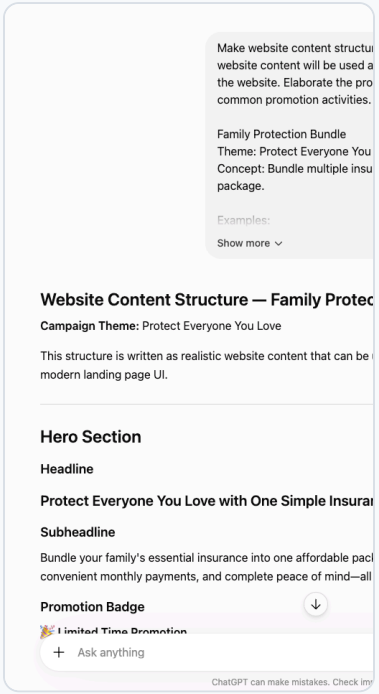
Acrylic painting style · Mixed media artwork · Visible brush strokes · Vibrant use of color · Consistent character proportions · Marketing-quality illustration

Rendering

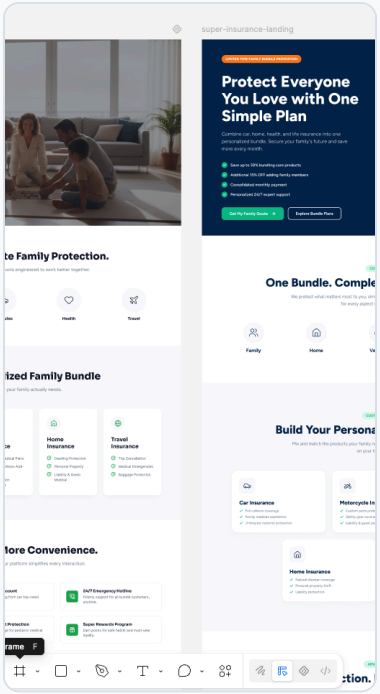
DESIGN PROCESS

AI-Generated Static Website

Design & build a 1-pager website in 1 day

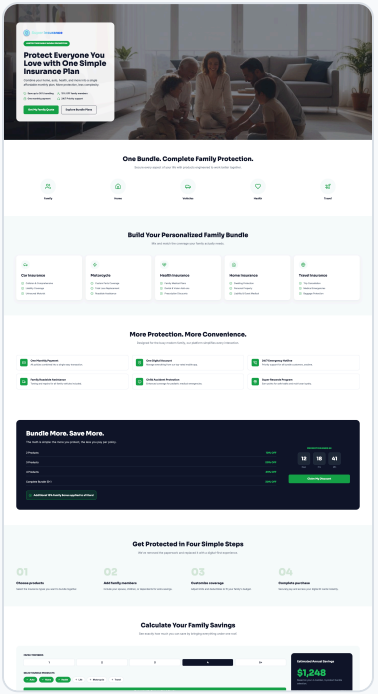


ChatGPT Prompting



Figma Exploration

Code Conversion

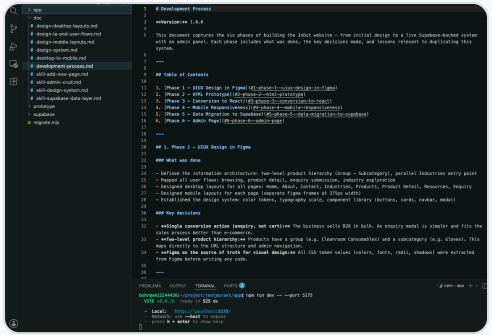


HTML Result

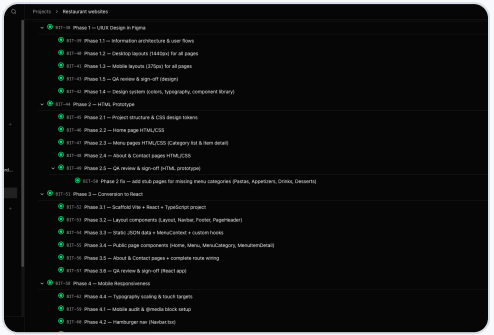
DESIGN PROCESS

AI-Generated Dynamic Website with CMS

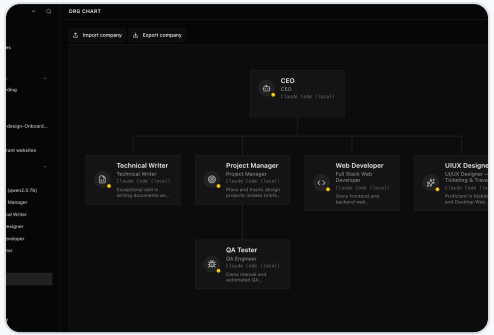
Semi-automate development process with AI Skills



Skill Set

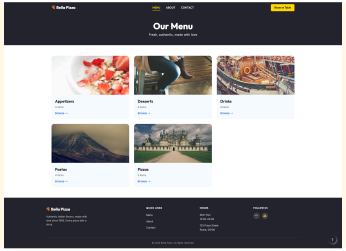


Running on Paperclip

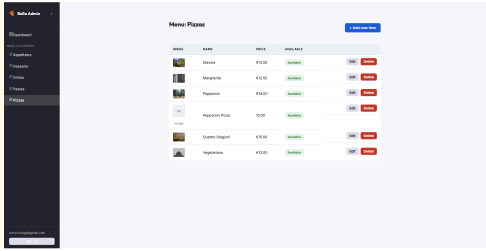


Paperclip Org

Agent Coding Result



Website



CMS

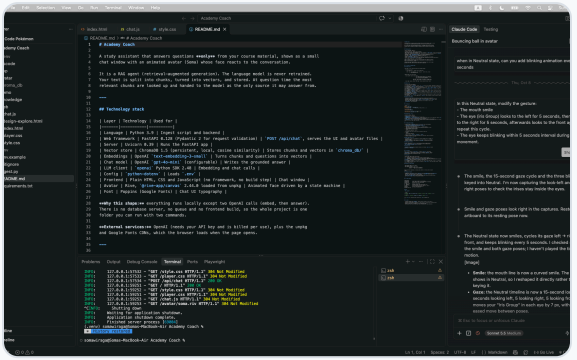
DESIGN PROCESS

AI-Assisted Agent Interaction

Animating an AI avatar's expressions with an agent in the loop

1 Design expressions

Define the avatar's moods: neutral, thinking, confused, happy, sad

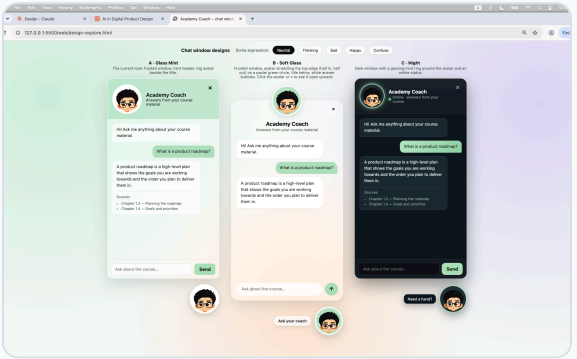


2 Prompt the agent

Describe each gesture to an agent in VS Code to build it in Rive

3 Monitor in Rive

Watch states and keyframes take shape in the Rive editor



4 Evaluate the result

Test each expression in the live chat UI, then iterate

ACTIVITY

Share your Design Process with AI

Clear notes

Write how you use AI in your design process, and the challenge you face

GROUP A

DESIGN PROCESS WITH AI

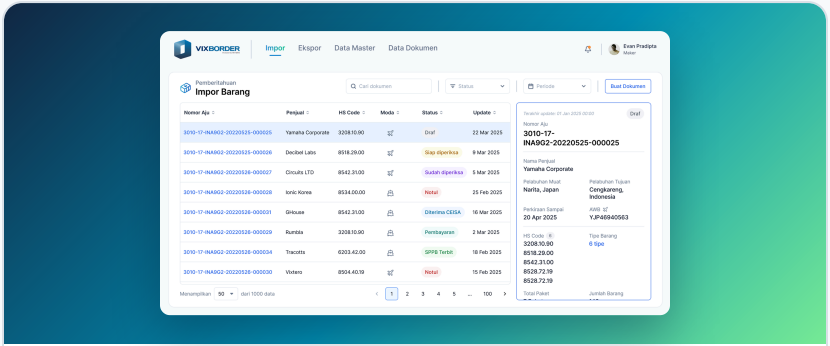
PART 03

Design for AI-Powered Products

PRODUCT DEMO

AI-Powered Products

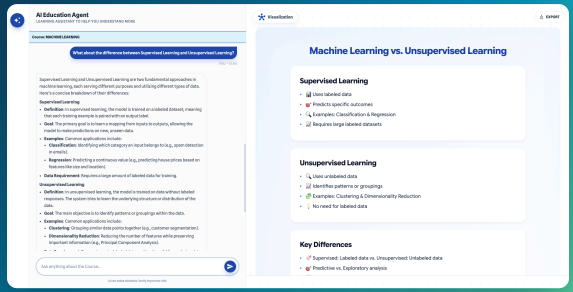
Two products where AI is the core, not an add-on



AI-Powered Document Processing

Extracts, reads, and structures documents automatically, replacing manual review.

See Video



RAG Agent with Generative UI

An agent that retrieves answers and builds the interface to show them, on the fly.

See Video

SUMMARY

Role of Design

Handling AI Processing Time

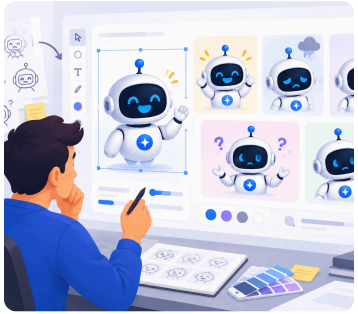
Designing loading, progress, and waiting states so latency doesn't feel like a broken product.

Awareness of AI Hallucination

Surfacing confidence, sources, and limits so people know when to double-check the output.

Keep Human in Control

Defining what the AI can act on its own, and where a person stays in the loop.



Shaping Behavior of the AI

The AI's character: how it converses, its style of language and expressions, aligned with the target customer and product brand.

Thank You

Let's discuss the AI use cases in your team.
